

## Introduction & Comparison

### What is an Array?

An array is a collection of elements of the same type, placed in contiguous memory locations that can be individually referenced by using an index to a unique identifier

`int arr[4] = {45, 6, 77, 54}` int → 4 bytes  
 index → 0 1 2 3 char → 1 byte  
 address → #10 #14 #18 #22  
 +4 →  
 #20 #21 #22 .....

### What is a Linked List?

A linked list is a collection of elements (nodes) that are NOT stored in contiguous memory locations. The nodes are linked to each other using pointers (entity that points to the next node). A node usually consists of 2 fields namely - data & next. Sometimes a 3rd field called id/name is also used.

Node (key, value, next)

## 1. Size of Data Structure

### ARRAYS

`int arr[4] = {34, 56, 6, 7}`  
 index → 0 1 2 3 4 bytes  
 address → #10 #14 #18 #22  
 4 × 4 = 16 bytes

**Size is STATIC**

### LINKED LIST

**Size is DYNAMIC**

## 2. Data Access/Read/Update (Cost)

### ARRAYS

`int arr[4] = {34, 56, 6, 7}`  
 index → 0 1 2 3 int = 4 byte  
 address → #10 #14 #18 #22  
 RANDOM ACCESS  $O(n) = 1$   
 $arr[3] = 7$   
 = Base Address + (index pos × Size of element)  
 = 10 + (3 × 4)  
 = 22

### LINKED LIST

SEQUENTIAL ACCESS

$O(n) = n \rightarrow$  Linear Time

### 3) Insertion & deletion of elements (Cost)

#### ARRAYS

1) Insertion/Deletion at the Beginning -

$$O(n) = n \text{ Linear}$$

2) Insertion/Deletion at the End -

$$O(n) = 1 \text{ Constant}$$

3) Insertion/Deletion at random nth position -

$$\rightarrow O(n) = n \text{ Linear}$$

#### LINKED LIST

1) Insertion/Deletion at the Beginning -

$$O(n) = 1 \rightarrow \text{Constant}$$

2) Insertion/Deletion at the End -

$$O(n) = n \rightarrow \text{Linear}$$

3) Insertion/Deletion at random nth position -

$$O(n) = n \rightarrow \text{Linear}$$

### 4) Memory Requirement & Memory Usage/Efficiency

#### ARRAYS

int arr[4] = {34, 56, 6, 7}  
index -> 0 1 2 3  
→ 

34	56	6	7
----	----	---	---

  
address -> #10 #14 #18 #22

arr[100] = 400 byte

34	56	6	7	...	...
----	----	---	---	-----	-----

Person obj → 18 bytes 18 × 3 = 54 bytes

Person obj[100] = 1800 byte

#### LINKED LIST

1 node = 12 byte

4 nodes = 12 × 4 = 48 byte

n1 n2 n3 = 78 byte

int = 4 byte  
8 byte  
+  
4

## 6) Searching Methods

### ARRAYS

```
int arr[4]={34,56,6,7}
index -> 0 1 2 (3)
      34 56 6 7
address -> #10 #14 #18 #22
```

- 1) Sequential Search
- 2) Binary Search.

### LINKED LIST

- 1) Sequential Search

## 6) Searching Methods

### ARRAYS

```
int arr[4]={34,56,6,7}
index -> 0 1 2 (3)
      34 56 6 7
address -> #10 #14 #18 #22
```

- 1) Sequential
- 2) Binary

**No one Data Structure can be considered as absolute best in all situations. It depends on the requirements/usecases/scenarios**

### LINKED LIST
